

Field Validation and Automation

Mandatory Fields: Employee ID, Request Type, Department, and Manager are enforced to prevent incomplete submissions.

Auto-Populate Logic: Current user, Manager, and Department values auto-fill using reference fields and dot-walking.

Date Validations: Ensures Joining Date < Exit Date, and prevents overlapping requests for the same employee.

Approval State Validation: Requests cannot progress until manager approval is completed, enforced via Flow Designer conditions.

Area	Actions Taken
Data Handling	Catalog variables (Employee ID, Dept, Dates, Manager, Assets) mapped to the Employee Lifecycle custom table for structured tracking.
Access Control	Implemented role-based ACLs : HR manages requests, IT/Facilities/Security handle tasks, Managers approve only for their reports.
QA Testing	Conducted unit, integration, and UAT to validate request creation, approvals, SLA tracking, notifications, and task completion.
Data Integrity	Enforced mandatory validations , auto-populated fields (Dept/Manager), date checks (Joining < Exit), and approval state enforcement.
